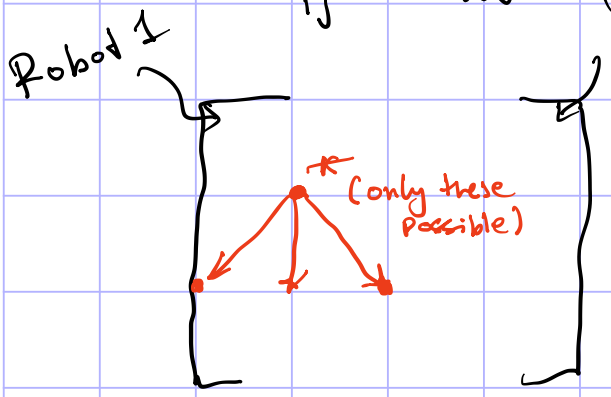
1463. Cherry Picker II

$m * n \rightarrow$ Grid

a_{ij} = no. of chocolate at (i, j) position.



* 2 robots visit ⇒ only counted once.
* restricted to grid.
* continue till no motion possible

Find max (Robo 1 + Robo 2)

Observations

* one row can be reached only ones. by one robot.

* one robot → scans and stores info and collects the max it can

2nd robo starts after 1st.

↳ Scans and collects → max from it can either stored / new discovery.

Might not be needed always as an robot can store vals that are never reachable by other

– scan time & memory is unnecessary.

Matrix are simply arrays.

if i know the data type size and no. of columns then.

- $loc(0,0) + (m-1) \times size(d)$
  or $(0, m-1)$
- $loc(0,0) + (m-1) \times size(d) + 1$
  or $(0, m-1)$
- $loc(0,0) + (m-1) \times size(d) - 1$
  or $(0, m-1)$

where address matches $\Rightarrow$ next best

sol^n $\Rightarrow$ {Requires DP concepts to solve it optimally.}
